

Flexible and marketspecific

PFI SafetyCert

PFI SafetyCert is a flexible certification concept for occupational, protective and safety footwear. It enables the strict requirements of the relevant EU regulation, the corresponding European standards and national legislation to be ideally harmonised with the market, product and production requirements of industry and trade.

PFI SafetyCert distinguishes between shoe types and article variants:

Types of footwear

Shoe types have defined safety-relevant components, the so-called type-defining properties. These are the same within a shoe type. They include the outsole, the toe cap, the insole and the puncture-resistant insole. On this basis, different articles can be integrated.

Article variations

Within one type of shoe, PFI SafetyCert offers a wide range of design options. Variations in upper materials, colours and designs, upper heights or outsole colours can be easily integrated. These variations are referred to as articles and are listed in the annex to the type examination certificate.

Type examination certificate

Within one type, any number of articles can be certified. New or modified articles can be added to an existing certificate at any time without great effort. PFI SafetyCert offers maximum flexibility and market orientation, especially for seasonal articles, customer-specific orders or regular model updates.

Orthopaedic insoles and orthopaedic modifications

PFI SafetyCert also offers suitable solutions when issuing type examination certificates for orthopaedically modified shoes or for the inclusion of different insoles. For example, additional insoles can be included in the annexes to an existing certificate.

ESD

ESD certificates can also be issued for the corresponding types. ESD certificates can also be issued independently of a type examination certificate..
